

EDF, A COMMITTED PLAYER IN CLIMATE ACTION

ANNUAL AVERAGE WATER USE* IN EDF THERMAL PLANTS (IN 2015)

Water quantity in billion of m³

The ratio
(water consumed / water withdrawn)
is around 1%

Annual water withdrawn variations, mainly as the result of the energy mix used (depending on the electricity demand which is strongly correlated to weather conditions), are very low, order of magnitude of the uncertainty.

The ratio
water consumed / energy produced
is around 1 l/kWh
